

Could your business recover?

Five questions to start a useful continuity conversation.

A missing answer is a place to investigate, not an assessment score.

1. What must return first?

List the applications, data and dependencies essential to serving customers.

2. How long can you wait?

Agree how long each priority system can be unavailable before serious impact.

3. How much recent work can you lose?

Compare backup frequency with the amount of re-entry or lost work you can accept.

4. Who checks that backups are working?

Name the person or team reviewing backup alerts, failures and covered systems.

5. When was recovery last tested?

Record the last restore test, its result, and any gaps or follow-up actions.

Check the whole environment

Include servers, laptops, Microsoft 365 / Google Workspace, cloud computers, accounting applications and other systems. Hosting, file sync, backup and continuity serve different purposes. Coverage and recovery options depend on your setup.

Need help filling the gaps? Ask Cayenne.
